

What is Carbon Pollution?

By Hans Schreuder – August 2017

Some examples to give the concept a visual reality:

Enorme zwarte rookwolken stijgen op vanaf de Afsluitdijk.

From the above pictures I am sure that you get the idea: carbon pollution is black, pitch black in fact.

How does this compare with the "carbon pollution" that politicians and so-called "green" pressure groups refer to when they raise concerns about the human-produced "carbon pollution"?

Maybe you're not aware of it, but the "pollution" that those holier-than-thou persons refer to is in fact carbon dioxide, a colourless, odourless gas that we all breathe out at 40,000 parts per million (ppm).

If you wanted to see carbon dioxide, just breathe out and you'll agree that it can't be seen and is in fact one of the most miraculous gases in our precious atmosphere: it is the gas of life!

Trees, plants, wheat, barley and all the goods that are literally green, all need carbon dioxide to grow and feed us or shelter us or provide the most fantastic array of colours to please the eye. Earth is also not "warmer than it should be" due to atmospheric carbon dioxide or an imaginary "greenhouse effect".

Just thought you'd like to know some facts. Get the facts, make the right decisions.
