Climate change science is an unverified hypothesis

Will Alexander alexwjr@iafrica.com

Friday 3 February 2012

I have attached my [memo](#) with the above title for your interest.

At last the climate change bubble is about to burst. I have attached the most extensive memo that I have yet produced.

In summary, there is no evidence to support the claims that climate change will increase floods and droughts.

There is also no evidence of environmental damage.

These are the core issues in climate change science.

I was in the middle of producing the memo when the news broke on the Internet that the global temperatures have not increased since 1997.

Put these three issues together and climate change theory becomes an empty shell.

In technical terms, climate change science is an unverified hypothesis.

The section on the [solar linkage](#) is new to science but the evidence is solid. The reason why the signal is clearer in southern Africa than in the high northern latitudes is that a greater proportion of the total received energy comes directly from the sun and the intervening cloud cover is very much less in our dry climate.

There is enough reading matter to keep you busy for a few days!

As always feel free to distribute this to anybody else who has an interest.

Regards,

Will
