

MAN-MADE? WHERE IS THE EVIDENCE?

Hans Schreuder – 23 November 2018

After decades of alarm calls over the impact of human emissions of carbon dioxide (CO₂) on global temperatures and climate change, a glaring lack of factually demonstrated and scientifically proven evidence remains.

The evidence presented has been based on computer modelling of temperatures from global weather stations, a larger percentage of which are sited in towns and cities and no data, numerous studies show, for the 70% of oceans, seas and lakes; satellite measurements are routinely adjusted to take account of anomalies and sea level rise alarm, expressed in measurements of millimetres per century, does not quantify in that tidal gauges are subjected to landmass upheavals and/or subsidence, none of which can be taken to represent empirical evidence.

The very concept of a global temperature has been called into question by numerous studies and considering that there are no data for the 70% of oceans, seas and lakes the concept that a global temperature can be derived from a few thousand weather stations is rather dubious.

Observing the ever-changing high and low pressure patterns – specifically in this case with regard to the UK – it becomes clear that most of the measured temperatures on land are the direct result of the direction from whence the wind has come. Huge hot air masses are routinely blown from the Sahara/cold air masses from Siberia/temperate air from the Atlantic.

Nitrogen and Oxygen could also be seen to be greenhouse gases since they retain heat to some degree before cooling, whereas water vapour and carbon dioxide are actually cooling gases as they are the only gases that can emit the infrared radiation to the void of space.

Sending that same radiation back to the surface of the earth can not make the earth any warmer than it was in the first place – c/f the Laws of Thermodynamics.

Neither is there evidence of ongoing and catastrophic melting of ice at the Arctic, Antarctic or Greenland icecaps – the only evidence indicates a cyclical nature of melting and freezing.

The list of climate related alarm calls is endless, so suffice to ask for evidence that can stand the scrutiny of scientific investigation, not the incidental, subjective and emotionally charged evidence that is presented on an almost daily basis by those who seek to control our lives by demonizing the emissions of CO₂ from human sources.

The UN IPCC* scientists sets human emissions contribution of CO₂ at 4% of total atmospheric CO₂ that is, only 16 parts per million of CO₂ is of human origin. See attached graphic.

There remains a need to establish what forces were at play predating human presence when atmospheric CO₂ levels were higher and temperatures 2-3 degrees higher than at present and the how and why creating that situation.

* https://tech-know-group.com/archives/IPCC_deception.pdf

Total
ATMOSPHERE weighs
approximately
5.3 million gigatonnes

Total
CARBON DIOXIDE
at 0.04% *by volume* weighs
approximately
0.003 million gigatonnes

Human-produced
CARBON DIOXIDE
is alleged to be about
4% of the total CO₂ and
weighs approximately
0.00012 million gigatonnes

Clarification: a gigatonne equals one million million kilograms:
1,000,000,000,000 kg = 1,000,000,000 tonnes

DRAWING NOT TO SCALE - if drawn to scale, neither the total carbon dioxide nor the alleged human-produced carbon dioxide would be visible.
